

Chapter 2

2.1) $T = 2 \text{ sec}, m = 20 \text{ gm}$

$$\frac{k}{m} = \omega^2 = \left(\frac{2\pi}{T} \right)^2 = \left(\frac{2\pi}{2} \right)^2 = \pi^2$$

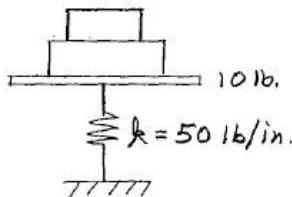

$$k = \pi^2 m = \pi^2 (20) = 197.4 \text{ dynes/cm}$$

2.2) $m = \frac{k}{\omega^2}$

$$m_{p_i} + m_{pkg} = \frac{k}{\omega^2}$$

$$m_{pkg} = \frac{k}{\omega^2} - m_{p_i}$$

$$W_{pkg} = m_{pkg} g = \frac{kg}{\omega^2} - m_{p_i} g = \frac{kg}{(2\pi\nu)^2} - W_{p_i}$$

$$W_{pkg} = \frac{50(32.2 \times 12)}{[2\pi(3)]^2} - 10 = 44.4 \text{ lb}$$

2.3) Fig. 1.8

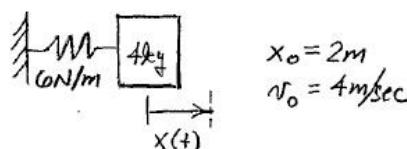

$$\omega = \sqrt{\frac{k_{eff}}{m}} = \sqrt{\frac{12EI}{mL^2}} = 2\sqrt{\frac{3EI}{mL^2}}$$

Fig. 1.9

$$\omega = \sqrt{\frac{k_{eff}}{m}} = \sqrt{\frac{48EI}{mL^2}} = 4\sqrt{\frac{3EI}{mL^2}}$$

The effect of clamping the roof is to increase the stiffness and, in doing so, double the natural frequency of the structure.

2.4) $\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{6}{4}} = 1.225 \text{ rad/sec}$

From Eq. (2.16):

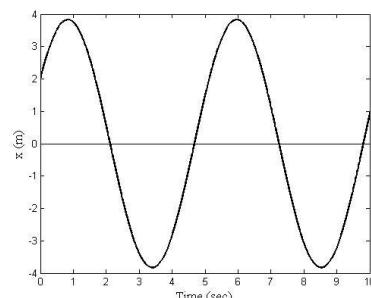

$$A = \sqrt{x_0^2 + (v_0/\omega)^2} = \sqrt{(2)^2 + (4/1.225)^2} = 3.830 \text{ m}$$

From Eq. (2.17):

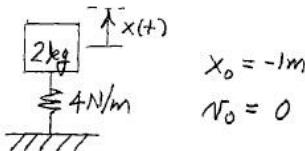

$$\phi = \tan^{-1} \left(\frac{v_0}{\omega x_0} \right) = \tan^{-1} \left(\frac{4}{1.225(2)} \right) = 58.51^\circ = 1.021 \text{ rads}$$

From Eq. (2.15):

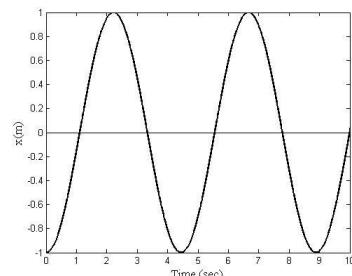

$$x(t) = 3.830 \cos(1.225t - 1.021) \text{ meters}$$

$$2.5) \quad \omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{4}{2}} = \sqrt{2} \text{ rad/sec}$$

$$A = 1 \text{ m}, \phi = \pi \text{ rads}$$

From Eq. (2.14):
$$\underline{x(t) = \cos(\sqrt{2}t - \pi) = -\cos(\sqrt{2}t)}$$
 meters

$$2.6) \quad A = \pi R^2 = \pi (1.25)^2 = 4.91 \text{ cm}^2, E_{al} = 6.90 \times 10^6 \text{ N/cm}^2, m = 20 \text{ kg} = 2 \times 10^4 \text{ g}$$

$$k_{eq} = \frac{E_{al} A}{L} = \frac{(6.90 \times 10^6)(4.91)}{30} = 1.13 \times 10^6 \text{ N/cm} = 1.13 \times 10^{11} \text{ dynes/cm}$$

$$\underline{\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{1.13 \times 10^{11}}{2 \times 10^4}} = 2380 \text{ rad/sec} = 378 \text{ cps}}$$

$$2.7) \quad I_\rho = mr_G^2 = 20(5)^2 = 500 \text{ kg} \cdot \text{cm}^2 = 5 \times 10^5 \text{ g} \cdot \text{cm}^2$$

$$J = \frac{\pi R^4}{2} = \frac{\pi (1.25)^4}{2} = 3.83 \text{ cm}^4$$

From Eq. (1.29): $k_T = \frac{JG}{L} = \frac{(2.76 \times 10^6)(3.83)}{30} = 3.52 \times 10^5 \text{ N} \cdot \text{cm/rad} = 3.52 \times 10^{10} \text{ dyne} \cdot \text{cm/rad}$

$$\underline{\omega = \sqrt{\frac{k_T}{I_\rho}} = \sqrt{\frac{3.52 \times 10^{10}}{5 \times 10^5}} = 265 \text{ rad/sec}}$$

- 2.9) If we treat the fluid as incompressible, we may think of the confined fluid as an incompressible/inextensible rod with vanishing bending stress. We may then recognize that the components of displacement, velocity, and acceleration along the path of the fluid are uniform. That is, they are the same for each fluid particle. Let us isolate a typical fluid element, (1) moving vertically and (2) moving horizontally, and draw the kinetic diagrams for each. Hence,

VERTICAL LEG:

$$A dp - \rho g A ds = \underline{\boxed{\square} \uparrow dm \dot{s}}$$

$(p + dp)A$

$A \sim \text{CROSS-SECTION AREA OF TUBE.}$

HORIZONTAL LEG:

$$(p + dp)A \rightarrow \boxed{\square} \leftarrow p dA = \underline{\boxed{\square} \rightarrow dm \dot{s}'}$$

$$A dp - \rho g A ds = \ddot{s} dm$$

$$A dp = \ddot{s} dm$$

$$\int_A^0 A dp - \int_A^0 \rho g A ds = \int_A^0 \ddot{s} dm \quad (1a)$$

$$\int_{0'}^{A'} A dp - \int_{0'}^{A'} \rho g A ds = \int_{0'}^{A'} \ddot{s} dm \quad (1b)$$

$$\int_{A'}^B A dp - \int_{A'}^B \rho g A ds = \int_{A'}^B \ddot{s} dm \quad (1c)$$

$$\int_0^{0'} A dp = \int_0^{0'} \ddot{s} dm \quad (1d)$$

Adding (1a)-(1d) and recognizing that $\int_A^0 = -\int_{0'}^A$ gives

$$A \int_0^{0'} dp + A \int_{A'}^B dp - \int_{A'}^B \rho g A ds = \ddot{s} \int_A^B dm$$

$$A(p_0 - p_{0'}) + A(p_B - p_{A'}) - \rho g Al = m \ddot{s} \quad (2)$$

where $m = \int_A^B dm = \rho AL$ and L is the total given length of the manometer fluid. Let y measure the height of manometer fluid above its equilibrium position. Then, since acceleration of all particles along the path is the same, $\ddot{s} = \ddot{y}$ and further, $l = 2y$ then substituting into (2):

$$-2\rho g A y = \rho A L \ddot{y}$$

or $\ddot{y} + \frac{2g}{L} y = 0$

Thus,

$$\underline{\underline{\omega = \sqrt{\frac{2g}{L}}}}$$

2.10) $k = 400 \text{ lb/in}$, $W = 200 \text{ lb}$

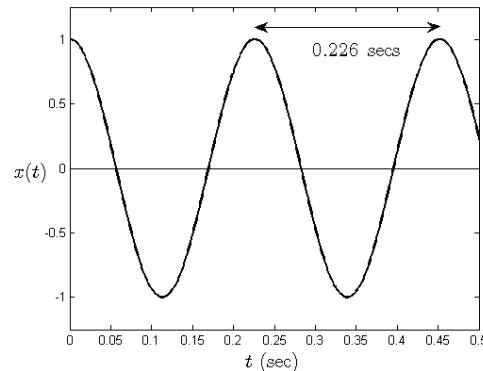

$$\omega = \sqrt{\frac{k}{W/g}} = \sqrt{\frac{400}{200/32.2 \times 12}} = 27.8 \text{ rad/sec}$$

$$T = \frac{2\pi}{\omega} = 0.226 \text{ sec}$$

From Eq. (2.14): $x(t) = x_0 \cos \omega t + \frac{v_0}{\omega} \sin \omega t$

$$x(t) = (1) \cos 27.8t + \frac{0}{27.8} \sin 27.8t$$

$x(t) = \cos 27.8t \text{ inches}$

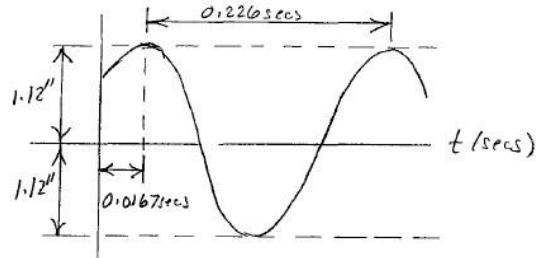

2.11) $x_0 = 1 \text{ in}, v_0 = 13.9 \text{ in/sec}, \omega = 27.8 \text{ rad/sec}, T = \frac{2\pi}{27.8} = 0.226 \text{ sec}$

$$A = \sqrt{(1)^2 + (13.9/27.8)^2} = 1.12 \text{ in}$$

$$\phi = \tan^{-1}\left(\frac{13.9}{27.8(1)}\right) = 0.464 \text{ rads}$$

$$t_\phi = \phi/\omega = 0.0167 \text{ sec}$$

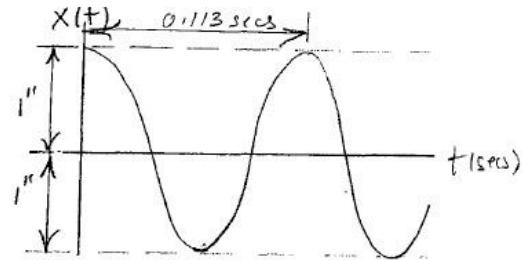

$$\underline{x(t) = 1.12 \cos(27.8t - 0.464) \text{ inches}}$$

2.12) From Prob. 1.6:

$$k = \frac{12EI}{L^3} = 3 \cdot \frac{4EI}{L^3} = 4(400 \text{ lb/in}) = 1600 \text{ lb/in}$$

$$\omega = \sqrt{\frac{k}{W/g}} = \sqrt{\frac{1600}{200/32.2 \times 12}} = 55.6 \text{ rad/sec}$$

$$T = \frac{2\pi}{55.6} = 0.113 \text{ sec}$$

$$\underline{x(t) = \cos 55.6t \text{ inches}}$$

2.13) The spring force is non-impulsive. Conservation of linear momentum:

$$m \cdot 0 + mv_1 = 2mv_2 \Rightarrow v_2 = \frac{1}{2}v_1$$

Thus, the initial velocity for 2-car system is $v_0 = \frac{1}{2}v_1$

$$k_{eq} = \frac{4EA}{L} = \frac{4\pi R^2 E}{L}$$

$$\omega = \sqrt{\frac{k_{eq}}{2m}} = \sqrt{\frac{4\pi R^2 E}{2mL}} = \sqrt{\frac{2\pi R^2 E}{mL}}$$

$$x(t) = x_0 \cos \omega t + \frac{v_0}{\omega} \sin \omega t$$

$$x_0 = 0, \frac{v_0}{\omega} = \frac{\frac{1}{2}v_1}{\sqrt{2\pi R^2 E/mL}} = \frac{v_1}{2R} \sqrt{\frac{ml}{2\pi E}}$$

$$\underline{x(t) = \frac{v_1}{2R} \sqrt{\frac{ml}{2\pi E}} \sin \sqrt{\frac{2\pi R^2 E}{mL}} t}$$

2.14) From Prob. 1.7: $k = 2.25 \times 10^3 \text{ lb/ft}$

$$x_0 = 1.01 \text{ in}, v_0 = 0$$

$$\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{2.25 \times 10^3}{200/32.2}} = 19.0 \text{ rad/sec}$$

$$\underline{\underline{x(t) = 1.01 \cos 19t \text{ inches}}}$$

2.15) From Prob. 1.15: $k = 3220 \text{ lb/ft}$

$$x_0 = 0.447 \text{ in}, v_0 = 0$$

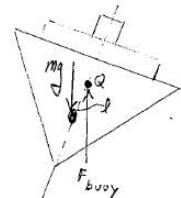

$$\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{3220}{200/32.2}} = 22.8 \text{ rad/sec}$$

$$\underline{\underline{x(t) = 0.447 \cos 22.8t \text{ inches}}}$$

2.16) $\sum M_G = I_G \ddot{\theta}$

$$-lF_{buoy} \sin \theta = I_G \ddot{\theta}$$

$$I_G \ddot{\theta} + lF_{buoy} \theta \approx 0$$

$$\omega^2 = \frac{lF_{buoy}}{I_G} = \frac{lmg}{I_G}$$

2.17) $T = \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{g/L}}$

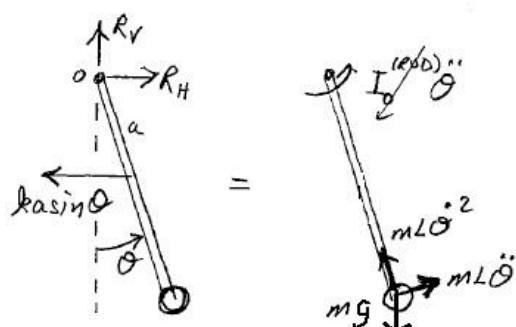

$$L = \frac{gT^2}{4\pi^2} = \frac{32.2(3)^2}{4\pi^2} = 7.34 \text{ ft}$$

2.18) $\sum \vec{M}_0 = I_0^{(rod)} \vec{\alpha} + \vec{r}_{bob} \times m\vec{a}_{bob}$

$$-a \cos \theta \cdot ka \sin \theta - L \cos \theta \cdot mg \sin \theta = L \cdot mL \ddot{\theta}$$

$$mL^2 \ddot{\theta} + [ka^2 + mgL] \sin \theta \cos \theta = 0$$

$$\sin \theta \cos \theta = \left[\theta - \frac{\theta^3}{3!} + \dots \right] \cdot \left[1 - \frac{\theta^2}{2!} + \dots \right] \approx \theta \ll 1$$

$$\ddot{\theta} + \left[\frac{ka^2 + mgL}{mL^2} \right] \theta = 0$$

$$\omega = \sqrt{\frac{ka^2 + g}{mL^2}} \frac{L}{a}$$

$$2.19) \quad \sum \bar{M}_0 = I_0^{(rod)} \ddot{\alpha} + \vec{r}_{cyl} \times m\vec{a}_{cyl}$$

$$-Lmg \sin \theta + k_T \theta = -L \cdot mL\ddot{\theta}$$

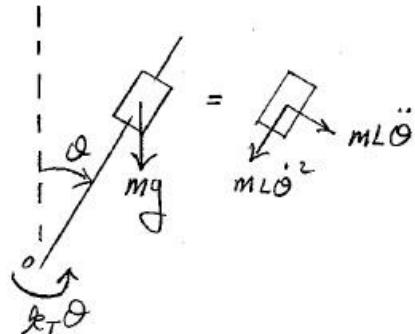

$$mL^2 \ddot{\theta} + k_T \theta - Lmg \sin \theta = 0$$

$$\sin \theta \approx \theta \ll 1$$

$$\ddot{\theta} + \left[\frac{k_T - mgL}{mL^2} \right] \theta = 0$$

$$\omega = \sqrt{\frac{g}{L} \left[\frac{k_T}{mgL} - 1 \right]}$$

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{\frac{g}{L} \left[\frac{k_T}{mgL} - 1 \right]}}$$

- 2.20) The solution follows that of Example 2.8, but with the moment of inertia now corresponding to a sphere rather than a disk. Thus, $I = \frac{2}{5}mr^2$

From Eqs. (h), (j), and (k) of Ex. 2.8:

$$I_p \left(\frac{R-r}{r} \right) \ddot{\theta} + mgr \sin \theta = 0$$

$$\text{where } I_p = I_G + mr^2 = \frac{2}{5}mr^2 + mr^2 = \frac{7}{5}mr^2 \text{ and } \sin \theta \approx \theta \ll 1$$

$$\frac{7}{5}mr^2 \left(\frac{R-r}{r} \right) \ddot{\theta} + mgr\theta = 0 \text{ or } \ddot{\theta} + \frac{g}{L_{eff}} \theta = 0$$

$$\text{where } L_{eff} = \frac{7}{5}(R-r) = \frac{7}{5}(100-1.5) = 137.9 \text{ cm}$$

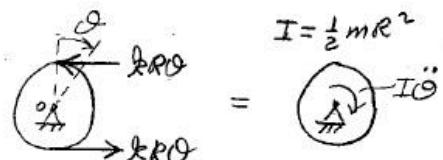

$$\omega = \sqrt{\frac{g}{L_{eff}}} = \sqrt{\frac{981}{137.9}} = 2.67 \text{ rad/sec}$$

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{2.67} = 2.36 \text{ sec}$$

$$t_{rise} = \frac{T}{2} = 1.18 \text{ sec}$$

$$2.21) \quad \sum M_0 = I\alpha : \quad 2kR^2\theta = -I\ddot{\theta}$$

$$\ddot{\theta} + \frac{2kR^2}{I}\theta = 0$$

$$\omega = 2\sqrt{\frac{k}{m}}$$

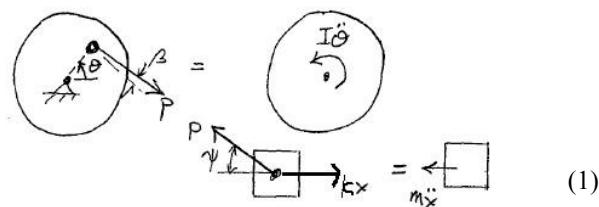

$$2.22) \quad \theta(t) = \theta_0 \cos \omega t + \frac{\omega_0}{\omega} \sin \omega t$$

$$\theta(t) = \theta_0 \cos 2\sqrt{\frac{k}{m}}t$$

2.23) Wheel: $\sum M_0 = I\alpha : -PR_0 \cos \beta = -I\ddot{\theta}$

$$I\ddot{\theta} + PR_0 \cos \beta = 0$$

$$\beta \ll 1 : I\ddot{\theta} + PR_0 \approx 0$$

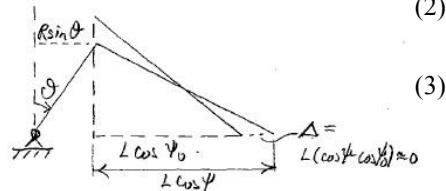

Block: $\sum F_x = ma_x : P \cos \psi - kx = m\ddot{x}$

$$\psi \ll 1 : m\ddot{x} + kx \approx P$$

(2) into (1)

$$I\ddot{\theta} + mR_0\ddot{x} + kR_0x = 0$$

Need $\theta - x$ relation \rightarrow

$$x = R_0 \sin \theta + L(\cos \psi - \cos \psi_0) \approx R_0 \theta \quad (4)$$

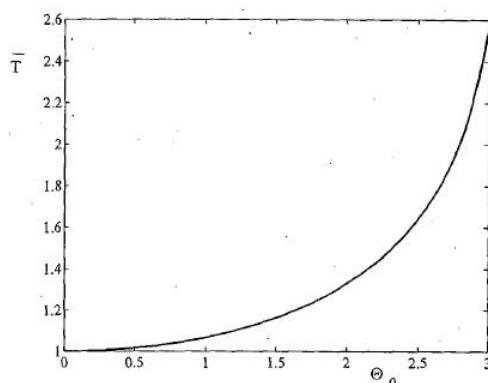

(4) into (3)

$$\left(\frac{I}{R_0} + mR_0 \right) \ddot{x} + kR_0x = 0$$

$$\omega = \sqrt{\frac{kR_0^2}{I + mR_0^2}}$$

2.24) (a) Execute the following Matlab code:

```
theta=0.01:0.01:3;
q=sin(theta/2);
m=q.*q;
Tbar=(2/pi)*ellipke(m);
plot(theta,Tbar)
```

$$(b) \quad \bar{T} = \frac{1}{1-E} = \frac{2}{\pi} F(m)$$

$$(i) \quad \bar{T} = \frac{1}{1-.05} = 1.05, \quad F(m) = \frac{\pi}{2} \bar{T} = \frac{\pi}{2} (1.05) = 1.65$$

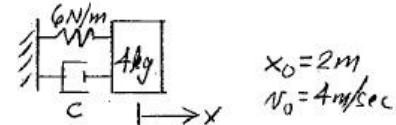

$$\underline{\underline{\theta_0 = 0.873 \text{ rad}}}$$

$$(ii) \quad \bar{T} = \frac{1}{1-.01} = 1.01, \quad F(m) = \frac{\pi}{2} \bar{T} = \frac{\pi}{2} (1.01) = 1.59$$

$$\underline{\underline{\theta_0 = 0.400 \text{ rad}}}$$

$$2.25) \quad (a) \quad c = 1 \text{ N} \cdot \text{sec/m}$$

$$\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{6}{4}} = 1.225 \text{ rad/sec}$$

$$\zeta = \frac{c}{2\omega m} = \frac{1}{2(1.225)(4)} = 0.1020$$

$$\omega_d = \omega \sqrt{1 - \zeta^2} = 1.225 \sqrt{1 - (0.1020)^2} = 1.219 \text{ rad/sec}$$

$$\zeta \omega = (0.1020)(1.225) = 0.1250 \text{ rad/sec}$$

$$A = 2 \sqrt{1 + \frac{\left[\frac{4}{(1.225)(2)} + 0.1020 \right]^2}{1 - (0.1020)^2}} = 4.020 \text{ m}$$

$$\phi = \tan^{-1} \left\{ \frac{\frac{4}{(1.225)(2)} + 0.1020}{\sqrt{1 - (0.1020)^2}} \right\} = 1.050 \text{ rad}$$

$$\underline{\underline{x(t) = 4.020e^{-0.1250t} \cos(1.219t - 1.050) \text{ meters}}}$$

$$(b) \quad c = 5 \text{ N} \cdot \text{sec/m}, \quad \omega = 1.225 \text{ rad/sec}$$

$$\zeta = \frac{c}{2\omega m} = \frac{5}{2(1.225)(4)} = 0.5100$$

$$\omega_d = \omega \sqrt{1 - \zeta^2} = 1.225 \sqrt{1 - (0.5100)^2} = 1.054 \text{ rad/sec}$$

$$\zeta \omega = (0.5100)(1.225) = 0.6248 \text{ rad/sec}$$

$$A = 2\sqrt{1 + \frac{\left[\frac{4}{(1.225)(2)} + 0.51 \right]^2}{1 - (0.51)^2}} = 5.368 \text{ m}$$

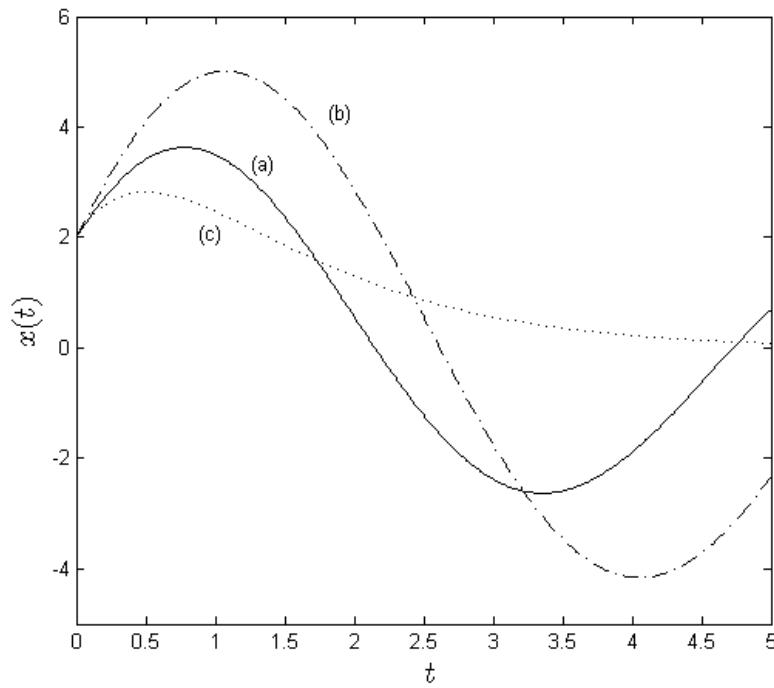

$$\phi = \tan^{-1} \left\{ \frac{\frac{4}{(1.225)(2)} + 0.51}{\sqrt{1 - (0.51)^2}} \right\} = 1.189 \text{ rad}$$

$$x(t) = 5.368e^{-0.6248t} \cos(1.054t - 1.189) \text{ meters}$$

(c) $c = 10 \text{ N} \cdot \text{sec/m}$, $\omega = 1.225 \text{ rad/sec}$

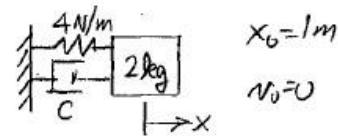

$$\zeta = \frac{c}{2\omega m} = \frac{10}{2(1.225)(4)} = 1 \text{ (critical damping)}$$

$$x(t) = [2 + \{4 + (1.225)(2)\}t]e^{-1.225t} = [2 + 6.45t]e^{-1.225t} \text{ meters}$$

$$2.26) \quad (a) \quad c = 2 \text{ N} \cdot \text{sec/m}, \quad \omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{4}{2}} = \sqrt{2} = 1.414 \text{ rad/sec}$$

$$\zeta = \frac{c}{2\omega m} = \frac{2}{2(\sqrt{2})(2)} = 0.3536$$

$$\omega_d = \omega \sqrt{1 - \zeta^2} = 1.323 \text{ rad/sec}$$

$$\zeta \omega = 0.500 \text{ rad/sec}$$

$$A = x_0 \sqrt{1 + \frac{\zeta^2}{1 - \zeta^2}} = \frac{x_0}{\sqrt{1 - \zeta^2}} = \frac{1}{\sqrt{1 - (0.3536)^2}} = 1.069 \text{ m}$$

$$\phi = \tan^{-1} \left\{ \frac{\zeta}{\sqrt{1 - \zeta^2}} \right\} = \tan^{-1} \left\{ \frac{0.3536}{\sqrt{1 - (0.3536)^2}} \right\} = 0.3614 \text{ rad}$$

$$x(t) = 1.069 e^{-0.5t} \cos(1.323t - 0.3614) \text{ meters}$$

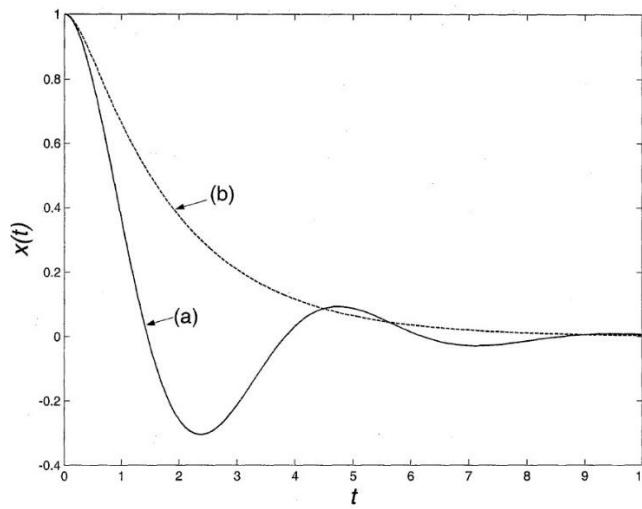

$$(b) \quad c = 8 \text{ N} \cdot \text{sec/m}, \quad \omega = \sqrt{2} = 1.414 \text{ rad/sec}$$

$$\zeta = \frac{c}{2\omega m} = \frac{8}{2(\sqrt{2})(2)} = 1.414 > 1 \text{ (overdamped system)}$$

$$z = \sqrt{\zeta^2 - 1} = \sqrt{(\sqrt{2})^2 - 1} = 1$$

$$\zeta \omega = 2 \text{ rad/sec}$$

$$x(t) = e^{-2t} [\cosh \sqrt{2}t + \sqrt{2} \sinh \sqrt{2}t] \text{ meters}$$

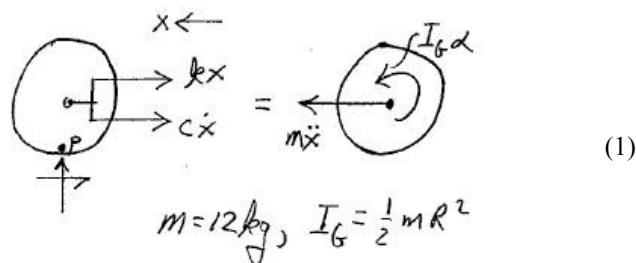

2.27) Kinetics:

$$\sum \vec{M}_P = I_G \bar{\alpha} + \vec{r}_{PG} \times m\vec{a}_{PG}$$

$$-(kx + c\dot{x})R = I_G \alpha + m\ddot{x}R$$

Kinematics for no slip:

$$x = R\theta, \quad \dot{x} = R\dot{\theta}, \quad \ddot{x} = R\ddot{\theta} \Rightarrow \alpha = \ddot{\theta} = \frac{1}{R}\ddot{x}$$

(1)

$$\begin{aligned} -(kx + c\dot{x})R &= \frac{1}{R}(I_G + mR^2)\ddot{x} \\ (2) \text{ into (1)} \quad &= \frac{1}{R}\left(\frac{1}{2}mR^2 + mR^2\right)\ddot{x} \\ &= \frac{3}{2}mR\ddot{x} \end{aligned}$$

$$\text{Thus, } \ddot{x} + \frac{2}{3}\frac{c}{m}\dot{x} + \frac{2}{3}\frac{k}{m}x = 0 \quad \text{or} \quad \ddot{x} + 2\omega\zeta\dot{x} + \omega^2x = 0$$

$$\text{where } \omega = \sqrt{\frac{2k}{3m}} = \sqrt{\frac{2}{3}\left(\frac{8}{12}\right)} = 0.7454 \text{ rad/sec}$$

$$2\omega\zeta = \frac{2c}{3m} \Rightarrow \zeta = \frac{c}{3\omega m} = \frac{8}{3(0.7454)(12)} = 0.2981$$

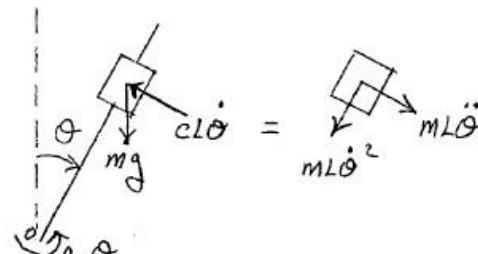

$$\omega_d = \omega\sqrt{1-\zeta^2} = 0.7454\sqrt{1-(0.2981)^2} = 0.7115 \text{ rad/sec}$$

2.28) $\sum \vec{M}_0 = I_0^{(rod)} \bar{\alpha} + \vec{r}_{cyl} \times m\vec{a}_{cyl}$

$$L \cdot cL\dot{\theta} - Lmg \sin\theta + k_T\theta = -L \cdot mL\ddot{\theta}$$

$$mL^2\ddot{\theta} + cL^2\dot{\theta} + k_T\theta - Lmg \sin\theta = 0 \quad \text{where } \sin\theta \approx \theta \ll 1$$

$$\text{Thus, } \ddot{\theta} + \frac{c}{m}\dot{\theta} + \left[\frac{k_T}{mL^2} - \frac{g}{L}\right]\theta = 0$$

$$\omega^2 = \frac{k_T}{mL^2} - \frac{g}{L}$$

$$2\omega\zeta = \frac{c}{m} \Rightarrow \zeta = \frac{c}{2\omega m} = \frac{c}{2m\sqrt{\frac{k_T}{mL^2} - \frac{g}{L}}}$$

$$\omega_d = \omega\sqrt{1-\zeta^2} = \sqrt{\frac{k_T}{mL^2} - \frac{g}{L} - \frac{c^2}{4m^2}}$$

$$2.29) \quad (a) \quad T = 2.6 \text{ sec}, \quad T_d = 3 \text{ sec}$$

$$\omega_d = \omega \sqrt{1 - \zeta^2} \Rightarrow \zeta^2 = 1 - \left(\frac{\omega_d}{\omega} \right)^2 = 1 - \left(\frac{2\pi/T_d}{2\pi/T} \right)^2 = 1 - \left(\frac{T}{T_d} \right)^2$$

$$\zeta = \sqrt{1 - \left(\frac{T}{T_d} \right)^2} = \sqrt{1 - \left(\frac{2.6}{3} \right)^2} = 0.50$$

$$(b) \quad x_1 = 1 \text{ in}, \quad x_4 = 0.1 \text{ in}, \quad n = 3$$

$$\text{From Eq. (2.89), } \bar{\delta} = \frac{1}{n} \ln \frac{x_1}{x_{n+1}} = \frac{1}{3} \ln \frac{1}{0.1} = 0.7675$$

$$\zeta = \frac{0.7675}{\sqrt{4\pi^2 + (0.7675)^2}} = 0.1213$$

$$2.30) \quad \sum M_0 = I\alpha: \quad k_T \theta + cl^2 \dot{\theta} - \frac{L}{2} W \cos \theta = -I\ddot{\theta}$$

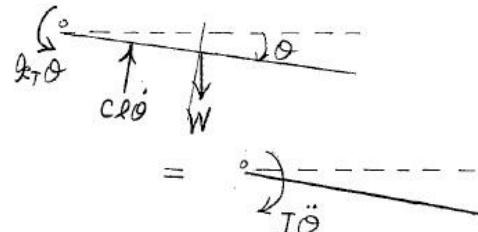

$$L = 7 \text{ ft}, \quad A = 2 \text{ ft}^2, \quad \gamma = 48 \text{ lb/ft}^3 \\ k_T = 13.45 \times 10^3 \text{ lb-in/rad}, \quad l = 2 \text{ ft}$$

$\cos \theta \approx 1$ for $\theta \ll 1$

$$\ddot{\theta} + \frac{cl^2}{I} \dot{\theta} + \frac{k_T}{I} \theta \approx \frac{WL}{2I}$$

or

$$\ddot{\beta} + \frac{cl^2}{I} \dot{\beta} + \frac{k_T}{I} \beta = 0 \text{ where } \beta(t) = \theta(t) - \theta_{static} = \theta(t) - \frac{WL}{2k_T}$$

$$I = \frac{1}{12} mh^2 + \frac{1}{3} mL^2 = \frac{1}{3} mL^2 \left[\frac{1}{4} \left(\frac{h}{L} \right)^2 + 1 \right] \approx \frac{1}{3} mL^2$$

$$I = \frac{1}{3} \frac{\gamma}{g} AL^3 = \frac{1}{3} \frac{(48)(2)(7)^3}{32.2} = 340.9 \text{ slug} \cdot \text{ft}^2$$

$$W = \gamma AL = (48)(2)(7) = 672 \text{ lb}$$

$$\omega = \sqrt{\frac{k_T}{I}} = \sqrt{\frac{13.45 \times 10^3}{340.9}} = 39.45 \text{ rad/sec}$$
